

User View

- View the instructions/prompt for the writing assignment
- User login
- Possible idea: initial questionnaire popup upon first login
 - Questions on writing ability, programming experience
 - This will be used for the initial gauge of writing and technical level
- A workspace to write
- Feedback popups (from a list of pre-made responses)
 - Possible idea: a way to figure out which popup would be most helpful. Identified from instructors, an implementation of multi-armed bandits, or something the AI does?
- Ability to request feedback (from AI)
- Ability to save work
- Ability to undo
- Ability to revert to their last save point
- A feature to “get started”
 - This provides a template / skeletal structure / something to start. based on the assignment to help students start writing
 - Idea is NOT to write it for them, but give them a jumping off point

Instructor View

- Login per user
- Assign users to an instruction / prompt, along with a deadline
- Select type of feedback for students to receive, based on a rubric selection
- Possible idea: view areas of writing students are struggling with, based on a rubric selection
- Possible idea: allow ability to run research studies (ability to randomly assign people into two groups. For example pre-fixed prompts only vs also AI, with or without get started feature...). Could also make a third researcher view for this

Backend

- Log changes between rounds of feedback
- Track order of feedback / edits
- Provide custom feedback based on
 - Gauged learner level
 - Past performance on when feedback was useful
 - Instructions

- Provide customized template based on
 - Past performance on when feedback was useful
 - Instructions
- Decide which pre-made prompt to show students
 - Again, this could be done by the instructor but we could explore implementing AI into this as wekk
